

SnapPitch - Data Governance & Data Quality Case Study

Portfolio case study | Oluwasola Sobola - Data Governance Team Lead | EPI-Tech Internship Programme

Platform AI-powered CV platform	Governance focus Privacy, quality, lifecycle, access, risk & Responsible AI
Role Data Governance Team Lead	Delivery model Cross-functional governance review and implementation recommendations

Project overview

SnapPitch is an AI-powered platform that enables users to register, upload a CV, build a professional profile, generate tailored CVs, and save and manage their information. The platform evolved from a session-only architecture to a registered-user model with persistent data storage, increasing the need for clear governance around personal information.

My role and governance responsibilities

- Led the Data Governance team and supported governance oversight across the project.
- Developed and reviewed the Data Governance Framework and governance implementation requirements.
- Supported protection of personally identifiable information (PII), data classification and sensitivity, data quality rules, privacy governance, AI governance, authentication/access controls, lifecycle and retention governance, and governance risk identification.

Key governance artefacts

- Data Governance Framework and governance responsibilities
- Privacy Policy, Privacy Notice, Cookies Consent Notice and Terms of Use
- Data Classification Framework and Data Quality Rules
- Data Lifecycle Governance and Data Retention Schedule
- AI Governance Review and Governance Risk Register
- Incident Response & Breach Escalation
- Administrative & Developer Access Policy

Governance review

The governance review assessed user registration, resume upload, profile creation, skills management, dashboard, account settings, privacy and security, and governance controls against privacy, transparency, security and data-quality principles.

Key observations identified

- Privacy information was not displayed before registration.
- Transparency around resume processing was limited.
- Email verification was not enforced.
- No cookie-consent banner was observed.
- Some input fields had weak data validation.
- Google authentication required clarification.

Recommendations

- Display the Privacy Notice before registration.
- Improve transparency around resume processing.
- Implement mandatory email verification.
- Introduce cookie consent where applicable.
- Strengthen validation controls.
- Clarify why five skills are required and confirm Google authentication functionality.
- Confirm implementation of governance artefacts, encryption, role-based access control, audit logging, data retention and AI governance.

Challenges and lessons learned

The platform architecture changed during development, requiring governance documentation to be updated while coordinating across multiple teams under time constraints. Key lessons were that governance should be embedded from the beginning, collaboration is essential, documentation supports accountability, and governance is a continuous process.

Value delivered

- Established a governance foundation and developed governance policies and standards.
- Conducted a governance review and identified improvement opportunities.
- Strengthened privacy and transparency.
- Supported Responsible AI governance and reduced governance risks.
- Supported the platform's future growth.

DATA GOVERNANCE • DATA QUALITY • RESPONSIBLE AI
